

TopBraid Enterprise Data Governance™

Metadata Management

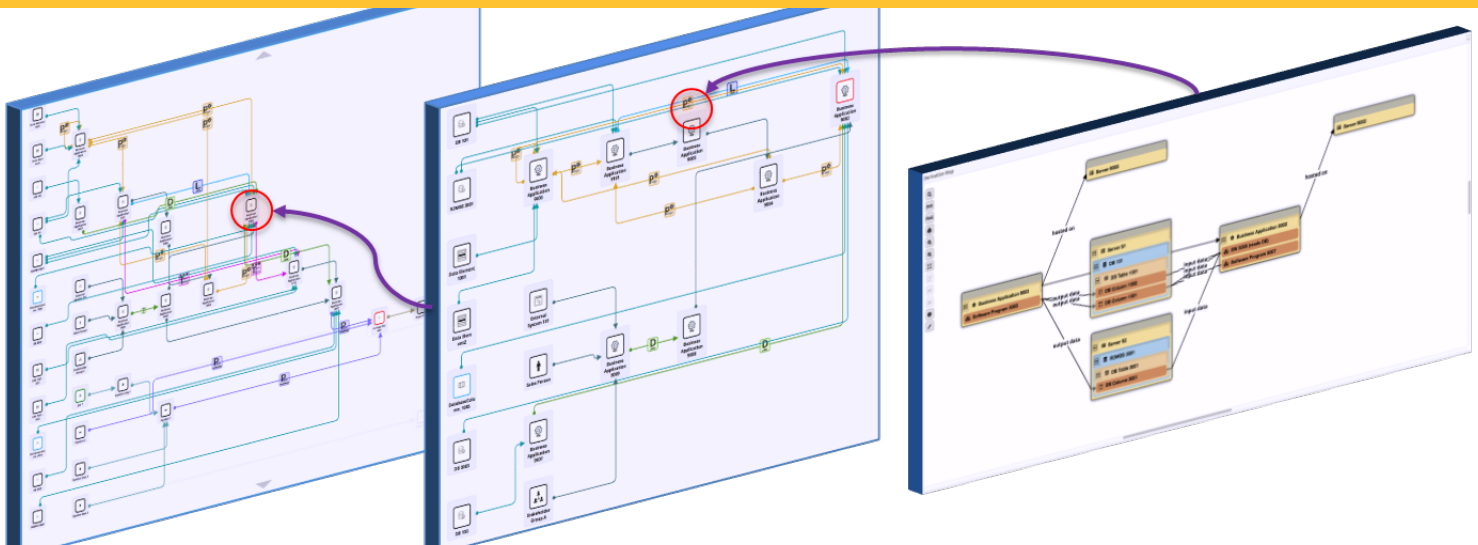

What's in it for you?

Enterprises need to manage their data while understanding the lineage of the data and its metadata. **TopBraid Enterprise Data Governance — Metadata Management (TopBraid EDG-MM)** lets organizations govern information about their data assets, software applications, infrastructure, business capabilities, and processes. It provides the capabilities to enable organizations to manage their data as assets and to directly link those assets in order to know the lineage of their data.

TopBraid EDG-MM lets enterprises create, connect and use:

- **Asset Collections** — Catalogs of resources that make up a data ecosystem including data, technical, and enterprise asset collections. These include: databases, data elements, datasets, systems, business applications, technical hardware, business functions, activities, processes and information assets.
- **Lineage Models** — Are used when there is a need for a more detailed specification of data transformations as it flows between data sources and applications to users. Assets in any collection can be directly linked with each other, e.g., to say that a business application stores data in some database.
- **Requirements** — Catalogs of relevant requirements such as data requirements, regulatory requirements, and security requirements. Supports traceability for other assets managed by EDG .

With TopBraid EDG-MM, enterprises benefit from lineage models that help to achieve key business goals such as operational efficiency, regulatory compliance and analytical insights:
